

Surface Water Management Map:

Surface water from the unnamed stream (Sorel farm source), and the motocross track (Property Holdings land), is discharged via the channel along the quarry haul road. Surface water that collects in the quarry sump is discharged into settlement lagoons as shown.

Discharging is minimised through the use of this water for:

- the production of concrete,
- as wash water, and
- dust suppression, in the quarry, at the top works and the motocross track.

The green arrows show pipework from pump stations to the top works holding tanks.

Excess surface water at the top works is discharged after filtration at the top works lagoons.
